Jessore University of Science and Technology, Jessore, Bangladesh.

ABSTRACT

Nowadays, the supply chain has become a buzzword in the business field. The only supply chain can help to lead a business in an organized way. However, in a supermarket, the supply chain is very important, but they need to ensure better communication with the supplier, customer, and internal management too. Each factor of the supply chain has a good effect on itself. The purpose of this research is to explore the important supermarket supply chain factors found in the literature and from supply chain experts and to develop a framework which can help to arrange the criteria in a sequence from most important to the worst by considering each sector of the supply chain. This paper has studied one of the supermarkets in Bangladesh, namely Save 'n' Safe. Authors have taken FAHP, one of the tools of MCDM, to figure it out the most effective factors. The result reveals that managing inventory, internal information sharing, and accurate demand forecasting are the most affected factors for the Save 'n' Safe (a supermarket). Finally, some recommendations have been given to improve the existing situation. This study can be used not only in the other supermarkets but also any other retail or grocery shops.

Keywords: Supply chain, FAHP, Supermarket, Decision making.

1. Introduction

Supermarket, a market to provide all daily needs from food to households. In 1930, Michael Cullen started the first supermarket in America [1]. Some private organizations in Bangladesh established the retail chain stores service focusing on the concept of global retailers. The first supermarket in Bangladesh is 'Agora' which was launched by Rahimafrooz Superstores Ltd. (RSL) in 2001 [2]. This business is rapidly changing the lifestyle of the urban people. So, day by day it is becoming more and more popular. Now, there are a number of supermarkets here. As a result, supermarket business is getting more competitive. It has become so tough to earn more

profit. There are the number of variables which effect on this profit. These variables are directly and indirectly integrated with the supply chain of the shop. Besides this, with the changes of the market supply and demand, as well as increasing business competition, the supply chain performance has become a key factor for supermarket development. To survive, everyone is focusing on the supply chain.

Supply chain of an organization can be simply defined as a set of directly involved entities in the upstream and downstream flows of products, services, finances, and/or information from a source to a customer [3]. The supply chain of a supermarket is wider from suppliers to customers. A supermarket usually keeps variety of products and their customers are also from various categories. Maintaining inter supply chain for the management is so complex. Proper performance of the supply chain helps the business to run with more profit.

‘Safe 'n' Save’ is a reputed supermarket in Khulna, Bangladesh. They receive their goods from the both local and outside suppliers, store them and directly sell to customers. The authors have studied to improve the performance of their supply chain. Possible factors which influence the chain of the supermarket have been identified. There are some methods to evaluate the performance. In this paper, F-AHP Buckley method has been used to rank the factors. Fuzzy Analytic Hierarchy Process (F-AHP) is a combination of fuzzy theory and Analytic Hierarchy Process (AHP). Fuzzy and AHP both are good fit for decision method. Guo and Yang [4] proved that the FAHP model was appropriate for the evaluation of the supermarket service.

2. Literature Review

The supply chain management is considered as a business strategy. It has evolved over time from a focus on optimizing internal processes of an organization [28, 29]. Lambert and Cooper [5] described that the overall performance of the supply chain is a synergy of the integrated organizations in the process of Supply chain management. Mehmeti et al. [6] reviewed some research papers and highlighted the factors that directly or indirectly influence the performance of the supply chain. They mentioned the supply chain performance as an aggregated performance of every company in the chain where the relationship among them plays a key role. Nandi et al. [7] studied on smallholder farmers who supply the fruits and vegetables to supermarket. They collected data from 127 farmers to identify the factors based on the transaction cost. Abunar et al. [8] described a conceptual framework for supermarket supply chain. Their aim was to help the researchers to utilize the current conditions of the supply-chain. Abunar and Zerban [9] facilitated the supply chain management between supermarkets by integrating the information systems and technology. The application of information system is prominent in the improvement of the supply chain where the technology will help to control the business and companies with better relation among the stakeholders, suppliers, and customers [9]. Gunasekaran et al. [10] improved the supply chain performance through management capabilities. In order to improve the performance, they analyzed some factors, such as supplier development capabilities, market

understanding capabilities, information systems capability, and skills/talent management capabilities. Vishal Gupta and Naseem Abidi [11] explored the factors which affect supply chain of IT products. They divided the factors into two parts: Retailer-Supplier Relationship and Retailer-Customer Relationship. The identified factors for retailer-supplier relationship were strategic partnership, information sharing, and use of technology. On the other side, the factors for retailer-customer relationship were customer orientation, customer service, and innovation. Finally, their paper concluded that four latent influences were associated with retailer-supplier relationship and five latent influences were associated with retailer-customer relationship [11].

Thomas and Saaty [12] introduced an effective tool Analytic Hierarchy Process (AHP) for dealing with complex decision making problems. Van Laarhoven and Pedrycz [13] proposed the first solution of the fuzzy AHP. In their proposed method they used the triangular fuzzy numbers and employed the Logarithmic Least Squares Method (LLSM) to generate elements of the priority vector (fuzzy weights). Buckley [14] analyzed the fuzzy set theory and used the trapezoidal fuzzy numbers to express the pair-wise comparison values.

Meng [15] applied FAHP to evaluate the service quality on rural supermarket. In his research, he used AHP to establish the weights and applied the multi-level fuzzy AHP to assess the rural supermarket service quality. Their result showed that rural supermarkets won better evaluation in terms of tangibles. Result of FAHP represented that comfortable shopping environment got 3.512 grades, abundant commodity got 3.562 grades, and especially 4.072 grades for payment. They also concluded their study by suggesting to improve the service image, to increase employees' knowledge, and to make strong employees' awareness of service [15]. Gopalan [16] evaluated the service quality of the retail service through the fuzzy AHP approach. Their research purpose was to integrate the fuzzy with analytic hierarchy process approach so that it can help the retailers in the practicing and judging the priorities of the service quality. Their identified dimensions for judging service quality were personal interaction, physical aspects, reliability, and policy. Authors of this paper have applied FAHP to identify and analyze the effected supermarket supply chain factors and have tried to provide the possible mitigation plans for the highest severity factors.

3. Problem Statement

Supply chain is such a chain of management which without a business cannot run; it works as a network. Problems occurred in any part of the chain basically impact on the whole supply chain as well as entire business. Overall, the supply chain becomes inefficient.

Safe 'n' Save supermarket has been serving here in Khulna, Bangladesh more than 15 years. Recently, the supermarket business has become too competitive here. Products price, products quality, and other important issues are almost same in every supermarket. If any supermarket develops their supply chain, then is there any probability to get better result in the business

strategy development? And, which parts of the supply chain should be developed to make sure the betterment of the business strategy?

Authors have tried to find the answer of the question in this paper through a case study conducted in Safe 'n' Save supermarket.

4. Research Methodology

In this paper, authors have done this research on a renowned supermarket in Bangladesh. At the initial stage of this study, the problems related to supermarket have been identified through the reading literatures and direct observation of the shop. Then, they have tried to conduct a case study to improve the supply chain. Researchers have collected data in two stages through two ways. The initial interview and initial survey help to understand the situation of the chain and scope to improve it. Next, they collect data through direct interview and survey. Remove the unnecessary data and prepare them for final analysis. Authors use FAHP technique to take decision on which parts and on which factors need to develop for improving the whole supply chain. Finally, they provide some suggestions based on the result. The flowchart in Figure 1 easily represents the methodology of this paper.

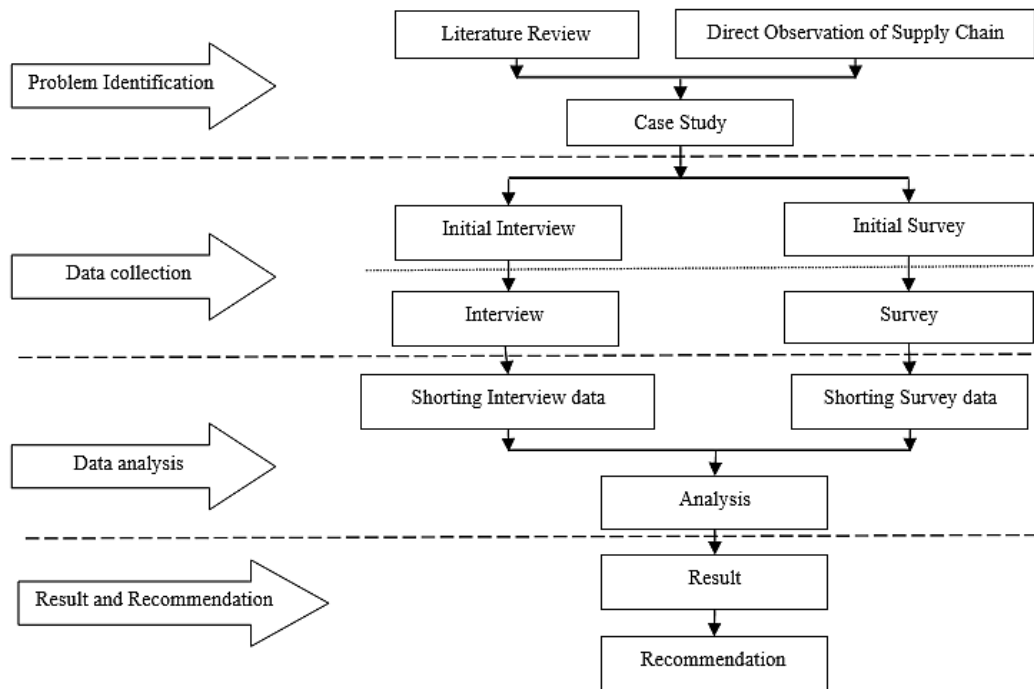

Figure 1. Methodology.

5. Fuzzy Analytic Hierarchy Process (F-AHP)

AHP is a multi-criteria decision making tool. Its main function is to make pairwise comparisons of different alternatives with respect to various criteria. The total analysis is completed in four levels. Integrating the logic approach helps the AHP to take decision better, especially include vagueness for personal judgments. Buckley [14] developed FAHP method where decision makers can employ the fuzzy ratios in place of exact ratios. The pairwise comparison and the criteria produce the fuzzy positive reciprocal matrices. The geometric mean method is used to determine the final fuzzy weights for the alternatives. The highest ranking contains all the undominated and the lowest ranking contains all dominated issues [14]. This method is implemented to determine the relative importance weights for both criteria and alternatives. The steps of the procedure are as follows:

Step 1. decision maker compares the criteria or alternatives via linguistic terms as shown in Table 1. According to the corresponding triangular fuzzy numbers of these linguistic terms, for example if the decision maker states ‘Criterion 1 (C1) is weakly important than Criterion 2 (C2)’, then it takes the fuzzy triangular scale as (2, 3, 4). On the contrary, in the pairwise contribution matrix of the criteria, comparison of C2 to C1 will take the fuzzy triangular scale as (1/4, 1/3, 1/2).

Table 1. Linguistic Terms and the Corresponding Triangular Fuzzy Numbers.

Saaty Scale	Definition	Fuzzy Triangular Scale
1	Equally important (Eq. Imp.)	(1, 1, 1)
3	Weakly important (W. Imp.)	(2, 3, 4)
5	Fairly important (F. Imp.)	(4, 5, 6)
7	Strongly important (S. Imp.)	(6, 7, 8)
9	Absolutely important (A. Imp.)	(9, 9, 9)
2		(1, 2, 3)
4	The intermittent values between	(3, 4, 5)
6	Two adjacent scales	(5, 6, 7)
8		(7, 8, 9)

The pair wise contribution matrix is shown in Eq. (1), where \tilde{d}_{ij}^k indicates the kth decision maker’s preference of ith criterion over jth criterion via the fuzzy triangular numbers. Here, ‘tilde’ represents the triangular number demonstration and for the example case, \tilde{d}_{12}^1 represents the first decision maker’s preference of first criterion over second criterion and equals to $\tilde{d}_{12}^1 = (2, 3, 4)$.

$$\tilde{A}^k = \begin{bmatrix} \tilde{d}_{11}^k & \tilde{d}_{12}^k & \cdots & \tilde{d}_{1n}^k \\ \tilde{d}_{21}^k & \tilde{d}_{22}^k & \cdots & \tilde{d}_{2n}^k \\ \vdots & \vdots & \vdots & \vdots \\ \tilde{d}_{n1}^k & \tilde{d}_{n2}^k & \cdots & \tilde{d}_{nn}^k \end{bmatrix}. \quad (1)$$

Step 2. If there is more than one decision maker, preferences of each decision maker (\tilde{d}_{ij}^k) are averaged and (\tilde{d}_{ij}) is calculated as in the Eq. (2).

$$\tilde{d}_{ij} = \frac{\sum_{k=1}^k \tilde{d}_{ij}^k}{k}. \quad (2)$$

Step 3. According to averaged preferences, pairwise contribution matrix is updated as shown in Eq. (3).

$$\tilde{A} = \begin{bmatrix} \tilde{d}_{11} & \tilde{d}_{12} & \cdots & \tilde{d}_{1n} \\ \tilde{d}_{21} & \tilde{d}_{22} & \cdots & \tilde{d}_{2n} \\ \vdots & \vdots & \vdots & \vdots \\ \tilde{d}_{n1} & \tilde{d}_{n2} & \cdots & \tilde{d}_{nn} \end{bmatrix}. \quad (3)$$

Step 4. According to Buckley [14], the geometric mean of fuzzy comparison values of each criterion is calculated as shown in Eq. (4). Here, \tilde{r}_i still represents triangular values.

$$\tilde{r}_i = \left(\prod_{j=1}^n \tilde{d}_{ij} \right)^{\frac{1}{n}}, \quad i = 1, 2, 3, \dots, n. \quad (4)$$

Step 5. The fuzzy weights of each criterion can be found with Eq. (5) by incorporating next 3 sub steps.

Step 5a. Find the vector summation of each \tilde{r}_i .

Step 5b. Find the (-1) power of summation vector. Replace the fuzzy triangular number to make it in an increasing order.

Step 5c. To find the fuzzy weight of criterion i (\tilde{w}_i), multiply each \tilde{r}_i with this reverse vector.

$$\tilde{w}_i = \tilde{r}_i \times (\tilde{r}_1 + \tilde{r}_2 + \cdots + \tilde{r}_n)^{-1} = (lw_i, mw_i, uw_i). \quad (5)$$

Step 6. Since \tilde{w}_i are still fuzzy triangular numbers, they need to defuzzified by center of area method proposed by Kamble and Parveen [33] via applying the Eq. (6).

$$M_i = \frac{lw_i + mw_i + uw_i}{3}. \quad (6)$$

Step 7. M_i is a non-fuzzy number, but it needs to be normalized by following Eq. (7).

$$N_i = \frac{M_i}{\sum_{i=1}^n M_i} \tag{7}$$

These 7 steps are performed to find the normalized weights of both criteria and the alternatives. Then by multiplying each alternative weight with the related criteria, the scores for each alternative is calculated. According to these results, the alternative with the highest score is suggested to the decision maker

6. Finding and Data Analysis

After observing the supply chain and reviewing a number of literatures, authors divide the whole supply chain of the super market into three parts: Supplier chain, Internal chain, and Customer chain. Supplier chain is a chain where activities, goods, money, and information move between supplier and supermarket. Internal chain is enclosed within the supermarket itself. The network of customer chain is connected from supermarket to customer. Total three groups were sent to collect these data.

6.1 Identify Factors and Construction of Structure

Discussing with the supply chain experts and studying some research papers, the following factors have been identified. Table 2 shows the identified factors for each chain with literature support. After identifying the important factors, authors have developed a hierarchical model based on AHP. Figure 2 is showing the structure of the hierarchical model.

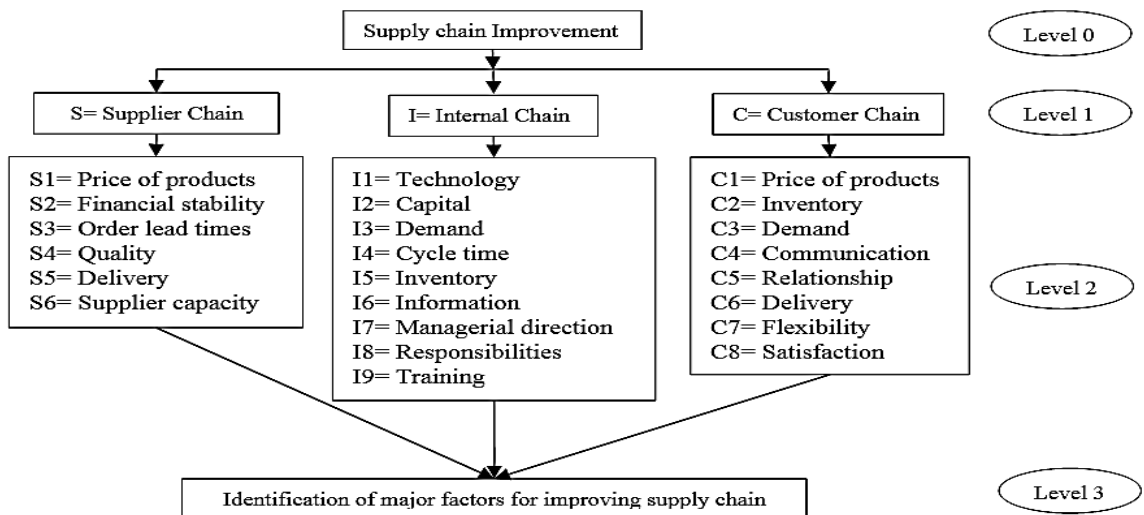

Figure 2. AHP Framework for Identifying Major Effected Factors.

Table 2. List of Factors.

SL	Factors	Explanation	Literature Support
Factors for supplier chain problems			
1	Price of products	Price is the amount of money at which the buyer and supplier agree to buy and sell of the products.	Naude and Badenhorst-Weiss [17]
2	Financial stability	It is the supplier financial health to continue the business.	Cancro and McGinnis [18]
3	Order lead times	It is the time between order placed to supplier and received by supermarket.	Naude and Badenhorst-Weiss [17]
4	Quality	It is the degree to which a product meets the requirements of the customer and makes satisfy them.	Naude and Badenhorst-Weiss [17]
5	Delivery	Transferring way and time of goods from one party to another party.	Gunasekaran et al. [19]
6	Supplier capacity	It is the ability of the supplier to meet the demand for the supermarket.	zhu and zhang [20]
Factors for internal chain problems			
1	Technology	Adaption of technology make the supply chain more simple.	Bhandari [21]
2	Capital	Limitation of capital funding of the supermarket effect on supply chain.	Naude and Badenhorst-Weiss [17]
3	Demand	Accurate demand management attracts more customers.	Mentzer et al. [22]
4	Cycle time	It is the time elapsed in between the customer order to delivery of goods.	Gunasekaran et al. [19]
5	Inventory	Managing inventory keep good relation with both suppliers and customers.	Mentzer et al. [22]
6	Information	Information sharing with each other effect on supply chain performance.	Koçoğlu et al. [23]
7	Managerial direction	Top management take all the decision related to supply chain.	Kanji and Wong [24]
8	Responsibilities	It is the ability to do work eagerly by yourself which improve supply chain.	Awasthi and Grzybowska [25]
9	Training	Teach to the employee to do work accurately.	Rouibah, et al. [26], Meehan and Muir [27]
10	Relationship	It includes internal relationship among employees.	Kanji and Wong [24]
Factors for customer chain problems			
1	Price of products	According to customer chain, it is the amount of money customer pay for the products.	Naude and Badenhorst-Weiss [17]
2	Inventory	Stock out or higher inventory effect on supply chain.	Naude and Badenhorst-Weiss [17]
3	Demand	Rapid changes in demand effect on supply chain.	W. Hasrulnizzam, et al (2009) [28]
4	Communication	Communicate with customers to know about market situation.	Naude and Badenhorst-Weiss [17]
5	Relationship	Relationship with all types of customer.	Kanji and Wong [24], Al-Shboul et al. [30]
6	Delivery	An increase in delivery performance means increase in service performance too.	Gunasekaran et al. [19]
7	Flexibility	Flexibility to customers ensure better sale of goods and return.	Gunasekaran et al. [19], Al-Shboul et al. [30]
8	Satisfaction	Future business actually depend of customer satisfaction.	Kanji and Wong [24], Ou et al. [31], Rao et al. [32]

6.2 Determining Weights for Parts

In order to determine the weights for major parts of the supply chain, three groups were developed including the manager of supermarket. Group A, group B, and group C sequentially observed each part of the supply chain of the supermarket and provided the weight of each part against others. According to their preferences, the averaged pairwise comparison of the criteria is represented by following Table 3. After receiving the data, the next step is to develop pairwise comparison matrix. According to Table 3, pairwise comparison matrix is formed in Table 4 for the major parts of the entire supply chain. This table usually provides the clear numeric weight of each part against other parts. In the next step, pairwise contribution matrix is updated by using Eq. (2) and shown in Table 5. In this table, the numerical weight value of the three groups is averaged. Now, using Eq. (4) the geometric mean of the fuzzy comparison values of each part is calculated. For instance, \tilde{r}_1 geometric mean of the fuzzy comparison values of ‘Supplier Chain’ part is calculated as Eq. (4).

$$\tilde{r}_i = \left(\prod_{j=1}^n \tilde{d}_{ij} \right)^{\frac{1}{n}} = \left[\left(1 \times \frac{10}{7} \times \frac{4}{5} \right)^{\frac{1}{3}} ; \left(1 \times \frac{16}{9} \times \frac{7}{6} \right)^{\frac{1}{3}} ; \left(1 \times \frac{9}{5} \times \frac{11}{7} \right)^{\frac{1}{3}} \right] = [1.0484; 1.2801; 1.4193].$$

Table 4. Pairwise Comparison Matric of Major Part.

Group A			
	Supplier Chain	Internal Chain	Customer Chain
Supplier Chain	(1,1,1)	(1/8,1/7,1/6)	(1/6,1/5,1/4)
Internal Chain	(6,7,8)	(1,1,1)	(4,5,6)
Customer Chain	(4,5,6)	(1/6,1/5,1/4)	(1,1,1)
Group B			
	Supplier Chain	Internal Chain	Customer Chain
Supplier Chain	(1,1,1)	(4,5,6)	(1/4,1/3,1/2)
Internal Chain	(1/6,1/5,1/4)	(1,1,1)	(1,1,1)
Customer Chain	(2,3,4)	(1,1,1)	(1,1,1)
Group C			
	Supplier Chain	Internal Chain	Customer Chain
Supplier Chain	(1,1,1)	(1/6,1/5,1/4)	(2,3,4)
Internal Chain	(4,5,6)	(1,1,1)	(2,3,4)
Customer Chain	(1/4,1/3,1/2)	(1/4,1/3,1/2)	(1,1,1)

Table 5. Updated Pairwise Comparison Matric of Major Part.

	Supplier Chain	Internal Chain	Customer Chain
Supplier Chain	(1,1,1)	(10/7,16/9,9/5)	(4/5,7/6,11/7)
Internal Chain	(17/5,4,19/4)	(1,1,1)	(7/3,3,11/3)
Customer Chain	(2,25/9,7/2)	(1/2,1/2,3/5)	(1,1,1)

Similarly, the geometric means of the fuzzy comparison values of all parts are calculated and shown in Table 6. In addition, the total values and the reverse values are also presented. In the last row of the same table, since the fuzzy triangular number should be in increasing order, the order of the numbers is changed. In the last stage of the fifth step, the fuzzy weight of 'Supplier Chain' is calculated by using Eq. (5).

$$\tilde{w}_1 = [(1.0484 \times 0.1894); (1.2801 \times 0.2125); (1.4193 \times 0.2478)] = [0.1986; 0.272; 0.3517].$$

Hence, the relative fuzzy weights of each criterion are calculated and shown in Table 7. After completing the first five steps of the methodology, the relative non-fuzzy weight of each parts (M_i) is calculated using Eq. (6). By using non-fuzzy (M_i), the normalized weights of each part are calculated in the seventh step applying Eq. (7), and tabulated in Table 8. Here, it is found that the internal chain absorbs the highest weight which is 0.4911 and the lowest weight, 0.2413, consumed by the customer chain.

Table 6. Geometric Means of Fuzzy Comparison of Each Part.

Parts	\tilde{r}_i		
Supplier Chain	1.0484	1.2801	1.4193
Internal Chain	1.9923	2.3021	2.5921

Customer Chain	0.1884	0.2388	0.3144

Table 8. Relative Non-Fuzzy and Normalized Weights of Each Part.

Parts	M_i	N_i
Supplier Chain	0.2741	0.2676
Internal Chain	0.5030	0.4911
Customer Chain	0.2472	0.2413
sum	1.0242	1.00

6.3 Determining Weights of Factors with Respect to Main Parts

The same methodology is applied to find the respective values for factors. That means, this analysis should be repeated for factors of each part. The updated pairwise contribution matrix for factors of supplier chain is represented in Table 9. The geometric mean, fuzzy weight, non-fuzzy weight, and normalized weight for the supplier chain factors are represented in Table 10. After finding the normalized weight of the supplier chain, the same procedure is also applied to find the weight of the internal chain factors. From pairwise contribution matrix for the factors of 'Internal Chain' in Table 11, authors calculated the geometric mean, fuzzy weight, non-fuzzy weight, and normalized weight which are represented in Table 12. At the same way, Table 13 shows the pairwise contribution matrix for the factors of 'Customer Chain'. And, geometric mean, fuzzy weight, non-fuzzy weight, and normalized weight for customer chain factors are represented in Table 14. In order to get the final result, multiply the normalized weight of the major parts with the normalized weight of their factors. Table 15 displays the final score of the factors and their rank.

7. Result and Discussion

In this study, the authors have shorted out and noted the six factors from supplier chain, ten factors from internal chain, and eight factors from customer chain. According to AHP, authors have also found the hierarchy structure in Figure 2. The Microsoft Excel was used for solving FAHP matrices. They have found the non-fuzzy and normalized weight for each major part in Table 8. It has been seen that the internal chain carries the highest normalized weight which is 0.4911. But, the weight of the other two parts is very closely; supplier chain has weighted 0.2676 and customer chain has weighted 0.2413. Similarly, the weights for all factors with respect to main parts have been identified using Microsoft Excel software. The Table 10, Table 12, and Table 14 are representing the non-fuzzy weights and normalized weights for factors of ‘Supplier Chain’, ‘Internal Chain’, and ‘Customer Chain’, respectively. Final result has been found by aggregating the relative weight of the major parts and the relative weight of the factors. Table-15 discloses the final result of this research. Buckley FAHP method has provided the highest score to inventory management of the internal part. Inventory of the supermarket mainly effects on the total supply chain of this supermarket. It is showing a total score of 0.1020; so, first of all, the authority of the shop should focus on the inventory management to improve the supply chain.

Again, information and demand of the internal chain have taken the second and third rank; their scores are 0.0719 and 0.0693, respectively. Communication with customers has covered the lowest score. At last stage, the authority should focus on this.

8. Recommendation

Possible suggestions to improve the top eight factors have been noted. The authors have analyzed and discussed with experts and supermarket managers to find the improving way. Table 16 shows the suggestions for major eight factors.

Table 16. Suggestions for Major Eight Factors.

Improvement factor	Major part	Suggestions
Inventory	Internal Chain	- Be careful to do accurate forecasting of demand.
		- Classify all the products into suitable categories using ABC, FNS techniques.
		- Use EOQ model before ordering goods.
		- Keep monitoring on goods.
Information	Internal Chain	- Strictly maintain the safety stock limit.
		- Solve the internal issues like incentive, facilities among the employers.
		- Install reliable and user-friendly IT equipment for sharing information.
		- Develop a trusted network for individuals to share information.
Demand	Internal Chain	- Provide better training to the employers.
		- Decision on demand management should be taken from group analysis rather than a single manager.
		- Gather appropriate knowledge of market and customers behavior to do accurate demand forecast.
		- Identify seasonal demand accurately.
Managerial Direction	Internal Chain	- Consider the discounts with demand calculation.
		- Identify the targeted consumer groups.
		- Goal and objective should be identified and fixed.
		- Design the better operating strategies including pricing methods, sales objectives, and advertising budgets.
Delivery	Supplier Chain	- Proper allocation of capital.
		- Redesign of store layout, product mix, promotion, process of packaging, and delivery of products,
		- Measure the capacity of supplier before selecting.
		- Avoid third parties as a supplier to get faster delivery.
Price of product	Supplier Chain	- Ensure the reliability of delivery.
		- Develop delivery strategies and appropriate transportation way.
		- Avoid third parties as a supplier to reduce product cost.
		- Improve dimensional weight during shipping.
Quality	Supplier Chain	- Try to remove excess materials as much as possible.
		- Develop a long term relationship with suppliers to get price negotiation.
		- Check the quality of products before receiving from supplier.
		- Prepare the right environment to the warehouse.
Satisfaction	Customer Chain	- Periodical benchmarking of product quality with the products of other suppliers.
		- Advice the customers to buy the best products depending on their needs.
		- Provide training to the staff on well behavior.
		- Avoid selling expired products.

9. Conclusion and Future Work

In this study, the supply chain of a supermarket has been analyzed. The performance measurement and improvement studies have looked over the entire supply chain. All participants in the supply chain had attended on this study. In addition, they were committed to the common goals. This research has found that every factor from any side of the supply chain effects on the performance of the entire supply chain. In order to improve or optimize the supply chain, it was required to find out the most effective factors; because, the priority of factors usually varies based on the needs of the participants. However, in this paper, authors had identified the possible factors from all sides. Next, they had applied the Fuzzy-AHP technique to find weight of each factor. Moreover, the analysis considered the weight of the individual part of the chain. This paper hint the manager of 'Save n safe' supermarket to focus on the inventory management, information sharing, demand forecasting, and managerial direction at first. After solving them, they should focus on supplier chain to improve the product delivery time and strategy, price of products, and quality of products. This research combined the fuzzy with AHP technique and helped to find the supply chain factors of 'Save n safe' supermarket alone with sector. Finally, the supply chain performance of the supermarket was improved by implementing the suggestions. This research was so flexible. In future, anyone can pick out more important factors or can divide the supply chain into more small part.

10. Limitation

Although the authors have done this research in a combination of theoretical and practical field, it has some constraints. Firstly, most of the considered factors in this study are subjective. So, it is always not possible to take the accurate measurement of the factors. Secondly, staffs and other participants in this research were busy with their work. As a result, researchers could not get the enough time to consult deeply. Last but not the least, limited number of the interviewers were considered in this study. In future, this number should be increased.

11. Acknowledgement

The authors would like to gratefully acknowledge the contributions of the staff of 'Save 'n' safe' supermarket in Khulna, Bangladesh. They would also like to express thanks and appreciation to other experts, suppliers, and customers who have provided the useful advice and information. And finally, the research team would like to thank MD. Safran hazi, managing director of 'Save 'n' safe' supermarket, who helped them at every stage of this work.
