# Number Theoretic Properties of the Commutative Ring $Z_{\boldsymbol{n}}$ 

Sh. Sajana ${ }^{1, * *}$, D. Bharathi ${ }^{2}$<br>${ }^{1}$ Department of Mathematics and Statistics, P.R. Govt. College (A), Kakinada, Andhra Pradesh, India.<br>${ }^{2}$ Department of Mathematics, S.V. University, Tirupati, Andhra Pradesh, India.

#### Abstract

This paper deals with the number theoretic properties of non-unit elements of the ring $Z_{n}$. Let $D$ be the set of all non-trivial divisors of a positive integer $n$. Let $D_{1}$ and $D_{2}$ be the subsets of $D$ having the least common multiple which are incongruent to zero modulo $n$ with every other element of $D$ and congruent to zero modulo $n$ with at least one another element of $D$, respectively. Then $D$ can be written as the disjoint union of $D_{1}$ and $D_{2}$ in $Z_{n}$. We explore the results on these sets based on all the characterizations of $n$. We obtain a formula for enumerating the cardinality of the set of all non-unit elements in $Z_{n}$ whose principal ideals are equal. Further, we present an algorithm for enumerating these sets of all non-unit elements.

Keywords: Non-unit elements, Non-trivial divisor, Least common multiple, Congruent, Finite commutative ring, Principal ideal.

## 1. Introduction

Number theory is a branch of mathematics and it is devoted primarily to the study of integers and the properties of counting numbers. The positive integers are undoubtedly man's first mathematical creation. In 17th century Fermat was the first to discover the deep properties of integers. Nathanson [1] introduced some specific arithmetical concepts of number theory, in particular the notion of congruence of numbers in graph theory and motivated the special way for emerging of a new class of undirected simple graphs, namely arithmetic graphs.

The set $U_{n}$ contains all the positive integers which are not exceeding $n$ and relatively prime to $n$, called the unit elements and cardinality of the set $U_{n}$ is $\varphi(n)$, the Euler totient function [2]. The set of all elements in the ring $Z_{n}$, the ring of integers modulo $n$ can be written as the disjoint

[^0]union of the sets, the set of all unit elements, $U_{n}$, and the set of all zero divisors, $Z\left(Z_{n}\right)$ of $Z_{n}$ [34]. The non-zero elements $a$ and $b$ in a ring $R$ are said to be zero divisors, if $a . b=0$. The set of all non-zero zero divisors in $R$ is denoted by $Z(R)^{*}=Z(R) \backslash\{0\}$ and we called $Z(R)$ as the set of non-unit elements.

Let $d$ be an element in $Z_{n}$, then the principal ideal of $d$ in $Z_{n}$ is $(d)=\{0, d, 2 d, \ldots, n-d\}$ and cardinality of $(d)$ is the number elements in $(d)$, denoted by $|(d)|$. In this paper, we mainly derived a formula for enumerating the cardinality of the set of all non-unit elements in $Z_{n}$ whose principal ideals are equal and also we present an algorithm for enumerating these sets of all nonunit elements.

## 2. Basic Properties of the Non-Trivial Divisors of $\boldsymbol{n}$ in $\boldsymbol{Z}_{\boldsymbol{n}}$

Definition 1. Every positive integer $n>1$ can be written as $n=p_{1}^{\alpha_{1}} p_{2}^{\alpha_{2}} \ldots p_{m}^{\alpha_{m}}$, where $p_{1}<p_{2}<$ $\cdots<p_{m}$ are primes, $\alpha_{i}$ is a positive integer for every $i=1,2, \ldots, m$ and $m \geq 1$, which is called the canonical representation of a positive integer $n$.

Definition 2. Let $a, b$, and $m$ be any positive integers. If $n$ divides the difference $a-b$, then we said that $a$ is congruent to $b$ modulo $n$ and we write $a \equiv b(\bmod n)$. In other words, it is equivalent to the divisibility relation $n \mid(a-b)$. If $n$ does not divide the difference $a-b$, then we say that $a$ is incongruent to $b$ modulo $n$ and we write $a \not \equiv b(\bmod n)$.

Definition 3. If a positive integer $n$ can be written as $n=c d$, for some positive integers $c$ and $d$. Then we say that $d$ divides $n$ or $d$ is a divisor of $n$ and written as $d \mid n$. Otherwise, we say that $d$ does not divide $n$ or $d$ is not a divisor of $n$ and written as $d \nmid n$. A divisor $d$ of $n$ is called trivial if $d \in\{1, n\}$, otherwise $d$ is called non-trivial divisor of $n$.

Let the set $D$ denotes the set of all non-trivial divisors of $n$, i.e., $D=\left\{d: d \mid n, d \in Z_{n}\right.$ and $d \neq 1$, $n\}$. The following theorem represents partition of the set $D$ in $Z_{n}$.

Theorem 1. Let $D_{1}$ and $D_{2}$ be the sets of all elements in $D$ having the least common multiple which is incongruent to zero modulo $n$ with every other element of $D$ and congruent to zero modulo $n$ with at least one another element of $D$, respectively. Then $D$ can be written as the disjoint union of $D_{1}$ and $D_{2}$ in $Z_{n}$.

Proof. Let $n>1$ be any positive integer. Then for any $d_{1} \neq d_{2}$ in $D$, we have

$$
\begin{aligned}
& D_{1}=\left\{d_{1} \in D:\left[d_{1}, d^{\prime}\right] \not \equiv 0(\bmod n), \text { for all } d^{\prime} \neq d_{1} \in D\right\} \text { and } \\
& D_{2}=\left\{d_{2} \in D:\left[d_{2}, d^{\prime}\right] \equiv 0(\bmod n), \text { for some } d^{\prime} \neq d_{2} \in D\right\} .
\end{aligned}
$$

Clearly $D$ is the union of $D_{1}$ and $D_{2}$, i.e., $D=D_{1} \cup D_{2}$. Now, we have to show that $D_{1}$ and $D_{2}$ are disjoint. Suppose $D_{1} \cap D_{2} \neq \emptyset$, let $q \in D_{1} \cap D_{2}$. Then $q \in D_{1}$ and $q \in D_{2}$. If $q \in D_{1}$, then $q$ can be written as $q=p_{1}{ }^{\alpha_{1}-1} p_{2}{ }^{\alpha_{2}-1} \ldots p_{m}{ }^{\alpha_{m}-1}$. Similarly, if $q \in D_{2}$, then $q$ can be written as $q=$
$p_{1} p_{2} \ldots p_{m}$. Therefore, $p_{1}{ }^{\alpha_{1}-1} p_{2}{ }^{\alpha_{2}-1} \ldots p_{m}{ }^{\alpha_{m}-1}=p_{1} p_{2} \ldots p_{m}$. This implies that $\alpha_{i}-1=1, \forall 1 \leq$ $i \leq m$. Therefore $\alpha_{i}=2, \forall 1 \leq i \leq m$ and hence $n=p_{1}{ }^{2} p_{2}{ }^{2} \ldots p_{m}{ }^{2}$, which shows that $q$ in $D_{1}$ but not in $D_{2}$ from the definitions of $D_{1}$ and $D_{2}$. This is a contradiction to the fact that $q \in D_{2}$. Hence the proof.

Example 1. In the ring $Z_{12}$, the set of all non-trivial divisors of 12 is $D=\{2,3,4,6\}$. The sets $D_{1}$ and $D_{2}$ are $D_{1}=\{2\}$ and $D_{2}=\{3,4,6\}$, which clearly shows that $D$ is the disjoint union of $D_{1}$ and $D_{2}$.

Lemma 1. In the ring $Z_{n}$, for every positive integer $n$ and every prime $p$, we have

- $D=\emptyset$, if $n=p$.
- $D_{1}=D$ and $D_{2}=\emptyset$, if $n=p^{\alpha}$ with $\alpha>1$.
- $D_{1}=\emptyset$ and $D_{2}=D$, if $n=p_{1} p_{2} \ldots p_{m}$ with $m>1$.
- $D=D_{1} \cup D_{2}$, both $D_{1}$ and $D_{2}$ are non-empty, if $n=p_{1}^{\alpha_{1}} p_{2}^{\alpha_{2}} \ldots p_{m}^{\alpha_{m}}$, where $\alpha_{i}$ is a positive integer, for all $1 \leq i \leq m$ and $\alpha_{1}+\alpha_{2}+\cdots+\alpha_{m}>m$ with $m \geq 2$.

## Proof.

- If $n=p$, then there does not exist non-trivial divisors of $n$ in the ring $Z_{n}$. Clearly $D=\varnothing$.
- If $n=p^{\alpha}$ with $\alpha>1$, then the set of all non-trivial divisors of $n$ in the ring $Z_{n}$ is $D=\left\{p, p^{2}\right.$, $\left.\ldots, p^{\alpha-1}\right\}$. Let $x$ and $y$ be any two distinct arbitrary elements in $D$. Then there exist two distinct positive integers $r$ and $s, 1 \leq r, s<\alpha$ such that $x=p^{r}$ and $y=p^{s}$. Now, the least common multiple of $x$ and $y$ is $[x, y]=\left[p^{r}, p^{s}\right]=p^{t} \not \equiv 0(\bmod n)$, where $t=\max \{r, s\}$. This shows that $D=D_{1}$.
- If $n=p_{1} p_{2} \ldots p_{m}$ with $m>1$, then the set of all non-trivial divisors $D$ of $n$ in the $\operatorname{ring} Z_{n}$ is, $D=$ $\left\{p_{1}, p_{2}, \ldots, p_{m}, p_{1} p_{2}, p_{1} p_{3}, \ldots, p_{m-1} p_{m}, \ldots, p_{1} p_{2} \ldots p_{m-1}, \ldots, p_{2} p_{3} \ldots p_{m}\right\}$. Suppose that $D_{1} \neq$ $\emptyset$, we assume $q \in D_{1}$. By the definition of $D_{1}$, element $q$ can be written as $q=$ $p_{1}{ }^{1-1} p_{2}{ }^{1-1} \ldots p_{m}{ }^{1-1}$, which contradicts to the fact that $D$ contains non-trivial divisors of $n$ in the ring $Z_{n}$. This completes the proof.
- If $n=p_{1}^{\alpha_{1}} p_{2}^{\alpha_{2}} \ldots p_{m}^{\alpha_{m}}$ with $\alpha_{1}+\alpha_{2}+\cdots+\alpha_{m}>m$ and $m \geq 2$. Now, we have to show that $D_{1}$ and $D_{2}$ are non-empty.

Subcase 1. Suppose that both $D_{1}$ and $D_{2}$ are empty. Then by the Theorem $1, D$ is empty. But, we know that the total number of non-trivial divisors of $n$ are $\left(\alpha_{1}+1\right)\left(\alpha_{2}+1\right) \ldots$
$\left(\alpha_{m}+1\right)-2>4$, which contradicts to the fact that $D$ is empty.
Subcase 2. Suppose that $D_{1}$ is non-empty and $D_{2}$ is empty. Without loss of generality, assume that $n=p^{2} q$. Then the set $D$ of non-trivial divisors of $n$ in the ring $Z_{n}$ is $D=\left\{p, p^{2}, q, p q\right\}$. So, there exists $p^{2} \in D$ such that whose the least common multiple is congruent to zero modulo $n$ with $q \in D$, i.e., $\left[p^{2}, q\right] \equiv 0(\bmod n)$. This shows that $p^{2} \in D_{2}$, which contradicts to the hypothesis that $D_{2}$ is empty.

Subcase 3. Suppose that $D_{1}$ is empty and $D_{2}$ is non-empty. Similarly in subcase 2, assume $n=$ $p^{2} q$. Then the set $D$ of non-trivial divisors of $n$ in the ring $Z_{n}$ is $D=\left\{p, p^{2}, q, p q\right\}$. We have, there exists $p \in D$ such that whose least common multiple is incongruent to zero modulo $n$ with every element in $D$, i.e., $[p, d] \not \equiv 0(\bmod n), \forall d \neq p \in D$. This shows that $p \in D_{1}$, which contradicts to the hypothesis that $D_{1}$ is empty.

Hence the proof follows from the above three subcases.
Theorem 2. The cardinality of the set of all non-zero zero divisors $Z\left(Z_{n}\right)^{*}$ in the ring $Z_{n}$ is $\left|Z\left(Z_{n}\right)^{*}\right|=n-\varphi(n)-1$.

Proof. For each $n>1$, we have $Z_{n}=U_{n} \cup Z\left(Z_{n}\right)$ and $U_{n} \cap Z\left(Z_{n}\right)=\emptyset$. Therefore, $\left|Z_{n}\right|=$ $\left|U_{n} \cup Z\left(Z_{n}\right)\right|$ and $\left|Z\left(Z_{n}\right)\right|=n-\varphi(n)$.

But $Z\left(Z_{n}\right)^{*}=Z\left(Z_{n}\right) \backslash\{0\}$ and hence $\left|Z\left(Z_{n}\right)^{*}\right|=n-\varphi(n)-1$.
Lemma 2. Let $x$ be any element in $P\left(D_{1}\right)=\left\{x \in Z_{n}:(x)=(d)\right.$, for some $\left.d \in D_{1}\right\}$. Then $[x, y] \not \equiv$ $0(\bmod n)$, for every $y \neq x$ in $Z\left(Z_{n}\right)^{*}$.

Proof. From the definition of $D_{1}$, we have $D_{1}=\left\{d_{1} \in D:\left[d_{1}, d^{\prime}\right] \not \equiv 0(\bmod n)\right.$, for all $d^{\prime} \neq d_{1} \in$ $D\}$, where $D$ is the set of all non-trivial divisors of a positive integer $n$. This implies that the proof follows.

Theorem 3. Let $P\left(D_{1}\right)=\left\{x \in Z_{n}:(x)=(d)\right.$, for some $\left.d \in D_{1}\right\}$ and $P\left(D_{2}\right)=\left\{x \in Z_{n}:(x)=\right.$ (d), for some $\left.d \in D_{2}\right\}$. Then the set of all non-zero zero divisors $Z\left(Z_{n}\right)^{*}$ of the ring $Z_{n}$ can be partitioned into the sets $P\left(D_{1}\right)$ and $P\left(D_{2}\right)$.

Proof. The set $D$ of all non-trivial divisors of a positive integer $n$ can be written as the disjoint union of the sets $D_{1}$ and $D_{2}$. This implies the set $Z\left(Z_{n}\right)^{*}$ can be partitioned into the sets $P\left(D_{1}\right)$ and $P\left(D_{2}\right)$ in the ring $Z_{n}$. (By the Theorem 1).

Example 2. In the ring $Z_{12}$, the set of all non-zero zero divisors is $Z\left(Z_{12}\right)^{*}=\{2,3,4,6,8,9$, $10\}$. The sets $P\left(D_{1}\right)=\{2,10\}$ and $P\left(D_{2}\right)=\{3,4,6,8,9\}$, which clearly shows that $Z\left(Z_{12}\right)^{*}$ is the disjoint union of $P\left(D_{1}\right)$ and $P\left(D_{2}\right)$, because $D=\{2,3,4,6\}, D_{1}=\{2\}$ and $D_{2}=\{3,4,6\}$.

Corollary 1. In the ring $Z_{n}$, for every positive integer $n$ and every prime $p$, we have

- $Z\left(Z_{n}\right)^{*}=\emptyset$, if $n=p$.
- $Z\left(Z_{n}\right)^{*}=P\left(D_{1}\right)$, if $n=p^{\alpha}$ with $\alpha>1$.
- $Z\left(Z_{n}\right)^{*}=P\left(D_{2}\right)$, if $n=p_{1} p_{2} \ldots p_{m}$, with $m>1$.
- $Z\left(Z_{n}\right)^{*}=P\left(D_{1}\right) \cup P\left(D_{2}\right)$, both $P\left(D_{1}\right)$ and $P\left(D_{2}\right)$ are non-empty, if $n=p_{1}^{\alpha_{1}} p_{2}^{\alpha_{2}} \ldots p_{m}^{\alpha_{m}}$, where $\alpha_{i}$ is a positive integer, for all $1 \leq i \leq m$ and $\alpha_{1}+\alpha_{2}+\cdots+\alpha_{m}>m$ with $m \geq 2$.

Proof. The proof directly follows from Lemma 1.

Lemma 3. For every non-trivial divisor $d$ of $n$, the cardinality of the set ( $d$ ), principal ideal of $d$ in the ring $Z_{n}$ is $|(d)|=\frac{n}{d}$.

Proof. We have, the principal ideal of $d$ in the ring $Z_{n}$ is $(d)=\{0, d, 2 d, \ldots, n-d\}$. It can be written as $(d)=\left\{0,1 d, 2 d, \ldots,\left(\frac{n}{d}-1\right) d\right\}$. Clearly, there is a one-to-one correspondence between $(d)$ and $\left\{0,1,2, \ldots, \frac{n}{d}-1\right\}$. So, the cardinality of the set $(d)$ is $\frac{n}{d}$.

## 3. Enumeration of Non-Unit Elements in $Z_{\boldsymbol{n}}$ Whose Principal Ideals Are Equal

In this section, we partition the set ( $d$ ) principal ideal of $d$, which is the union of the sets $S_{d}$ and $T_{d}$ for every non-trivial divisor $d$ of $n$, where $S_{d}=\left\{r d \in Z_{n}:(r d)=(d), 1 \leq r<\frac{n}{d}\right\}$ and $T_{d}=$ $\left\{r d \in Z_{n}:(r d) \neq(d), 1 \leq r<\frac{n}{d}\right\}$. Also, we define the set $S_{d}{ }^{\prime}=\left\{r d \in Z_{n}:(r d, n)=d, 1 \leq r<\right.$ $\frac{n}{d}$ \} and proved that $S_{d}=S_{d}$ ' for every non-trivial divisor $d$ of $n$. Next we obtained a formula for enumerating the cardinality of the set $S_{d}$ for all $d$ in $D$.

Theorem 4. Let $S_{d}=\left\{r d \in Z_{n}:(r d)=(d), 1 \leq r<\frac{n}{d}\right\}$ and $T_{d}=\left\{r d \in Z_{n}:(r d) \neq(d), 1 \leq r<\right.$ $\left.\frac{n}{d}\right\}$, for all $d$ in $D$. Then $(d)=S_{d} \cup T_{d}$, where $S_{d} \cap T_{d}=\emptyset$.

Proof. Since ( $d$ ) in the ring $Z_{n}$ consists of all the multiples of $d$ in $Z_{n}$ and $(d)=(n-d)$, where $n-d \in(d)$ in $Z_{n}$, for all $d$ in $D$. The total number of elements in $(d)$ in the ring $Z_{n}$ can be written as the disjoint union of two sets such that one of sets is consisting of all elements in $Z_{n}$, whose principal ideals are equal to (d) and the another set is consisting of all elements in $Z_{n}$, whose principal ideals are not equal to $(d)$ in the ring $Z_{n}$, that is

$$
(d)=\left\{r d \in Z_{n}:(r d)=(d), 1 \leq r<\frac{n}{d}\right\} \cup\left\{r d \in Z_{n}:(r d) \neq(d), 1 \leq r<\frac{n}{d}\right\} .
$$

Setting $S_{d}=\left\{r d \in Z_{n}:(r d)=(d), 1 \leq r<\frac{n}{d}\right\}$ and $T_{d}=\left\{r d \in Z_{n}:(r d) \neq(d), 1 \leq r<\frac{n}{d}\right\}$.
Hence $(d)=S_{d} \cup T_{d}$.
Notations 1. For every non-trivial divisor $d$ of $n$ in the ring $Z_{n}$, we define the set $S_{d}{ }^{\prime}$ as $S_{d}{ }^{\prime}=$ $\left\{r d \in Z_{n}:(r d, n)=d, 1 \leq r<\frac{n}{d}\right\}=\left\{r d \in Z_{n}:\left(r, \frac{n}{d}\right)=1,1 \leq r<\frac{n}{d}\right\}$.

Theorem 5. [5]. Let $A$ and $B$ be any two non-empty sets. Then $A=B$ if and only if $|A|=|B|$ and $A \subset B$.

Theorem 6. Let $d$ in $S_{d}{ }^{\prime}$ of the ring $Z_{n}$. For any $r d$ in $S_{d}{ }^{\prime}$ with $\left(r, \frac{n}{d}\right)=1,1<r<\frac{n}{d}$, we have $(d)=(r d)$, where $d$ is a non-trivial divisor of $n$.

Proof. We define a function $g:(d) \rightarrow(r d)$ by the relation $g(d)=r d, \forall d \in(d)$.

- For $x, y \in(d)$, we have $g(x)=g(y)$. This implies that $r x=r y$, where $r$ is a unit in $Z_{\frac{n}{d}}$, because $\left(r, \frac{n}{d}\right)=1$. So there exists $r^{-1} \in Z_{\frac{n}{d}}$ such that $r r^{-1}=1$.
Now, $r^{-1}(r x)=r^{-1}(r y)$

$$
\begin{aligned}
& \Rightarrow\left(r^{-1} r\right) x=\left(r^{-1} r\right) y \\
& \Rightarrow 1 \cdot x=1 \cdot y \\
& \Rightarrow x=y
\end{aligned}
$$

This shows that $g$ is one-to-one function.

- For each unit element $r$ in $Z_{\frac{n}{d}}$, there exists $r^{-1}$ in $Z_{\frac{n}{d}}$. For each $r^{-1}(r d) \in(r d)$, there exists $r^{-1} d \in$ (d) such that $g\left(r^{-1} d\right)=r\left(r^{-1} d\right)=\left(r r^{-1}\right) d=d$.

This shows that $g$ is onto function.
Thus there exists a bijection between $(d)$ and $(r d)$, when $\left(r, \frac{n}{d}\right)=1$. This implies that $|(d)|=$ $|(r d)|$, we have $(r d) \subset(d)$ in the ring $Z_{n}$ and hence by the Theorem 5, $(d)=(r d)$.

Corollary 2. For any non-trivial divisor $d$ of $n$ and for two distinct elements $x$ and $y$ in $S_{d}{ }^{\prime}$ of $Z_{n}$, we have $(x)=(y)$.

Proof. From the definition of $S_{d}{ }^{\prime}, S_{d}{ }^{\prime}=\left\{r d \in Z_{n}:\left(r, \frac{n}{d}\right)=1,1 \leq r<\frac{n}{d}\right\}$ and from Theorem 5, $(d)=(r d)$, for all $r d$ in $S_{d}{ }^{\prime}$ and for any non-trivial divisor $d$ of $n$. This implies that the proof follows.

Theorem 7. For any non-trivial divisor $d$ of $n$, we have $S_{d}=S_{d}{ }^{\prime}$.
Proof. We know that $S_{d}=\left\{r d \in Z_{n}:(r d)=(d), 1 \leq r<\frac{n}{d}\right\}$ and $S_{d}{ }^{\prime}=\left\{r d \in Z_{n}:\left(r, \frac{n}{d}\right)=1,1 \leq r<\frac{n}{d}\right\}$.

Clearly, from the Corollary 2, we have $S_{d}{ }^{\prime} \subseteq S_{d}$. Now we prove that the another inclusion $S_{d} \subseteq$ $S_{d}{ }^{\prime}$. For this let $x \in S_{d}$, then there exists $r, 1<r<\frac{n}{d}$ such that $x=r d$. Now, it is enough to show that $x \in S_{d}{ }^{\prime}$. If possible, assume that $x \notin S_{d}{ }^{\prime}$.

$$
\begin{aligned}
& \Rightarrow \quad\left(r, \frac{n}{d}\right) \neq 1 \\
& \Rightarrow \quad(r d, n) \neq d \\
& \Rightarrow \quad(r d) \subset(d)
\end{aligned}
$$

which contradicts to the fact that $(r d)=(d)$. This implies that our assumption is not true. Hence $S_{d}=S_{d}{ }^{\prime}$.

Theorem 8. For any non-trivial divisor $d$ of $n$, the cardinality of the set $S_{d}$ in the ring $Z_{n}$ is $\left|S_{d}\right|=$ $\varphi\left(\frac{n}{d}\right)$.

Proof. By the definition, $S_{d}$ and $S_{d}{ }^{\prime}$ are two non-empty subsets of $Z_{n}$ and by the Theorem $7, S_{d}$ and $S_{d}{ }^{\prime}$ are equivalent. So, each element $r d \in\{0,1,2, \ldots, n-1\}$ has a unique highest common factor with $n$ and therefore belongs to one and only one of the sets $S_{d}$. This means that the subsets $S_{d}$ 's forms a partition of $Z\left(Z_{n}\right)^{*}$.

Now, by the definition of $S_{d}$, we have $s \in S_{d}{ }^{\prime}$ if and only if $(s, n)=d$ if and only if $(r d, n)=d$, where $s=r d$ if and only if $\left(r, \frac{n}{d}\right)=1,1 \leq r<\frac{n}{d}$. Therefore, the number of elements in $S_{d}$ is equal to the number of elements to $r$, which is relatively prime to $\frac{n}{d}$ and this is equal to $\varphi\left(\frac{n}{d}\right)$.

Example 3. In the $\operatorname{ring} Z_{8}, D=\{2,4\}$.

- For $d=2$, we have $\left|S_{2}\right|=\varphi\left(\frac{8}{2}\right)=2$, because 2 and 6 are two elements in $S_{2}$ such that (2)=(6).
- For $d=4$, we have $\left|S_{4}\right|=\varphi\left(\frac{8}{4}\right)=1$, because 4 is the only element in $S_{4}$.

Example 4. In the ring $Z_{24}, D=\{2,3,4,6,8,12\}$.

- For $d=2$, we have $\left|S_{2}\right|=\varphi\left(\frac{24}{2}\right)=4$, because 2,10, 14 and 22 are four elements in $S_{2}$ such that $(2)=(10)=(14)=(22)$.
- For $d=3$, we have $\left|S_{3}\right|=\varphi\left(\frac{24}{3}\right)=4$, because 3, 9, 15 and 21 are four elements in $S_{3}$ such that $(3)=(9)=(15)=(21)$.
- For $d=4$, we have $\left|S_{4}\right|=\varphi\left(\frac{24}{4}\right)=2$, because 4 and 20 are two elements in $S_{4}$ such that $(4)=$ (20).
- For $d=6$, we have $\left|S_{6}\right|=\varphi\left(\frac{24}{6}\right)=2$, because 6 and 18 are two elements in $S_{6}$ such that (6)= (18).
- For $d=8$, we have $\left|S_{8}\right|=\varphi\left(\frac{24}{8}\right)=2$, because 8 and 16 are two elements in $S_{8}$ such that (8) $=$ (16).
- For $d=12$, we have $\left|S_{12}\right|=\varphi\left(\frac{24}{12}\right)=1$, because 12 is the only element in $S_{12}$.

## 4. Algorithm

In this section, we present an algorithm for enumerating the sets of all non-unit elements in $Z_{n}$ whose principal ideals are equal.

### 4.1 Algorithm

Step 1. Start
Step 2. Read input $n$
Step 3. Initialize i, j, k, s, sl, r, t, super [500] [500]
Step 4. $i \leftarrow 2$
Step 5. $j \leftarrow 1$
Step 6. $r \leftarrow i{ }^{*} j$
Step 7. $s \leftarrow r(\bmod n)$
Step 8. If ( $s=0$ ) then goto step 9 else step 18
Step 9. Super $[j][n] \leftarrow j$
Step 10. $k \leftarrow 1$
Step 11. $t \leftarrow j^{*} k$
Step 12. $s 1 \leftarrow t(\bmod n)$
Step 13. If $(s l=0)$ then goto step 15 else goto step 14
Step 14. Super $[j][s 1] \leftarrow s 1$
Step 15. If $(k<n)$ then goto step 16 else goto step 18
Step 16. $k \leftarrow k+1$
Step 17. Goto step 11
Step 18. If $(j<n)$ then goto step 19 else goto step 21
Step 19. $j \leftarrow j+1$
Step 20. Goto step 6
Step 21. If $(i<n)$ then goto step 22 else goto step 24
Step 22. $i \leftarrow i+1$
Step 23. Goto step 5
Step 24. Print principal ideals
Step 25. End.

## Subroutine algorithm

Step 1. Start
Step 2. $j \leftarrow 0$
Step 3. If (super $[j][n]=0)$ then goto step 11 else goto step 4
Step 4. Print super [j] [n]
Step 5. $i \leftarrow 0$
Step 6. If (super $[j][i]=0)$ then goto step 8 else goto step 7
Step 7. Print super [j] [i]
Step 8. If $(i<0)$ then goto step 9 else goto step 11
Step 9. $i \leftarrow i+1$
Step 10. Goto step 6
Step 11. If $(j<n)$ then goto step 12 else goto step 14
Step 12. $j \leftarrow j+1$
Step 13. Goto step 3
Step 14. End.

### 4.2 Outputs

In this section, we gave the outcome results when we run the program in C-language for various values of $n$, which is based on the above Algorithm.

- For given number $n=10$, then the outcomes are
(5),
(2) $=(4)=(6)=(8)$,

Principal ideal(2)=\{0,2,4,6,8\},
Principal ideal $(4)=\{0,2,4,6,8\}$,
Principal ideal $(5)=\{0,5\}$,
Principal ideal(6) $=\{0,2,4,6,8\}$,
Principal ideal $(8)=\{0,2,4,6,8\}$.
That is, in the ring $Z_{10}, 2,4,5,6$ and 8 are non-unit elements such that $(2)=(4)=(6)=(8)$ and (5) is a different set.

- For given number $n=16$, then the outcomes are
(8),
(4) $=(12)$,
(2) $=(6)=(10)=(14)$.

Principal ideal $(2)=\{0,2,4,6,8,10,12,14\}$,
Principal ideal $(4)=\{0,4,8,12\}$,
Principal ideal $(6)=\{0,2,4,6,8,10,12,14\}$,
Principal ideal $(8)=\{0,8\}$,
Principal ideal $(10)=\{0,2,4,6,8,10,12,14\}$,
Principal ideal(12) $=\{0,4,8,12\}$,
Principal ideal $(14)=\{0,2,4,6,8,10,12,14\}$.
That is, in the ring $Z_{16}, 2,4,6,8,10,12$ and 14 are non-unit elements such that $(2)=(6)=$ $(10)=(14),(4)=(12)$ but (8) is only a different set.

Similarly, we found the sets of non-unit elements whose principal ideals are equal for large values of $n$ also.

## 5. Conclusions

In this paper, we discussed the number theoretic properties of non-unit elements of a finite ring $Z_{n}$ in different forms of $n$. The set of non-trivial divisors of $n$ were divided into two disjoint sets (i.e. $D=D_{1} \cup D_{2}$ and $D_{1} \cap D_{2}=\emptyset$ ). The results were obtained by using these two sets for different characterizations of $n$. Also, the cardinality of non-unit elements of $Z_{n}$ were enumerated whenever their corresponding principle ideals were equal. Finally, the results were verified with suitable examples by using algorithm of C-program.

## Acknowledgements

The authors wish to express their cordial thanks to the reviewers for their excellent suggestions and also thanks to Sri K. Muralidhar Naidu for valuable suggestions to improve presentation of this paper.

## Appendix

Here, we present a program in C-language for finding the sets of all non-unit elements in $Z_{n}$ whose principal ideals are equally generated in $Z_{n}$ along with their corresponding principal ideals, for various values of $n$.

```
#include <dirent.h>
#include <stdio.h>
#include <errno.h>
#include <string.h>
main ( int argc, char *argv[])
{ get_zero_div(atoi(argv[1]));
}
get_zero_div( int p )
{ char zdiv[1000], pidl[1000], super[1000][1000], test;
    int i, j, k, r, s, t, c, m=0, n=2, cnt=0, key;
    for( i=0; i<1000; i++)
    zdiv[i]='N';
    for (i=0; i<1000; i++)
    pidl[i] = 'N';
    for (i=2; i<p; i++ )
        {
        for (j=2; j<p; j++ )
        {
            r=I*j;
            s = (r % p );
            if ( }\textrm{s}==0\mathrm{ )
```

```
            { zdiv[i] = 'Y';
                zdiv[j] = 'Y';
    }
            }
            }
for (i=0; i<1000; i++ )
{
    super [i][0] = -1;
    super [i][1] = -1;
}
For(i=0;i<p;i++ )
{
    If ( zdiv[i] == 'Y' )
{
super [m][n] = i;
n++;
        for ( j=1; j<p; j++ )
                { t= I* j;
                        s = (t % p);
                if (s == 0)
                {
                    break;
                                }
                        pidl[s] = 'Y';
                }
    }
for (k=0; k<p;k++ )
{
    if(pidl [k] == 'Y')
        {
        super[m][n] = k;
        super[m][1]++;
        n++;
        }
}
        super[m][1]++;
        for ( k=0; k<1000; k++ )
        pidl[k] = 'N';
m++;
n=2;
}
}
for (i=0; i<1000; i++ )
if ( super[i][1] == -1 )
    break;
    cnt = i;
for(i=0; i<=cnt; i++ )
    { super[i][0] = (i+1);
    key = super[i][1];
```

```
        for ( j=0; j<=cnt; j++ )
            { test = 'N';
            If ( super[j][1] == key )
                {
                    for ( k=2; k<=key+2; k++ )
                        if ( super[i][k] == super[j][k] )
                        test = 'Y';
                        else
                        test = 'N';
                }
                    If ( test == 'Y' )
                    super[j][0] = i+1;
        }
        }
for (i=0; i<=cnt; i++ )
{ test = 'N';
    {for ( j=0; j<=cnt; j++ )
        if ( super[j][0] == I )
            {
            printf( "(%d) = ", super[j][2]);
            test='Y';
        }
        If ( test == 'Y' )
        printf ( "\n" );
    }
}
printf ( "\n" );
for (i=0; i<1000; i++)
    {
        for ( }\textrm{j}=2;\textrm{j}<1000; j++ 
            {
                    if ( (super[i][j])! = 0 )
                {
                    if (j == 2)
                    printf ( "Principal ideal(%d) = {0,",super[i][j] );
                    else
                    printf ( "%d,", super[i][j] );
        }
        if( super[i][j] == 0 )
            {
                    printf ( "}\n" );
                    break;
            }
            }
        if( super[i][2] == 0 )
            { printf( "\n" );
                break;
            }
        }
}
```
